FACTS ABOUT YOUR EYES

Your eyes have some natural forms of protection that you should appreciate. They are fitted efficiently into sockets guarded by bone all around. Eyelids blink at a threat of danger; eyelashes flick dust and tiny particles away and tears act as an automatic sprinkler system to keep your eyes clear of troublesome substances. You can't however, depend on these things for 100 per cent protection. You need safety goggles and glasses to help out on jobs where there is danger to the eyes. Are you protecting yours enough?
